

# 2x1 Changeover Units

## Description

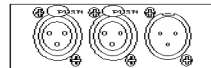

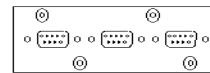

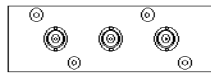

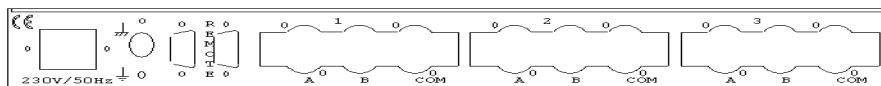

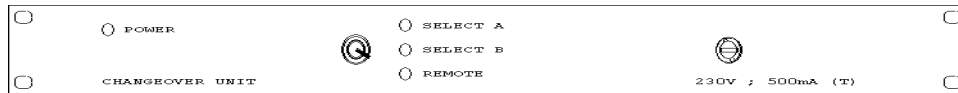

Designed around ultra-reliable, wide-band relay switches, these provide the emergency bypass switch function essential to all transmission facilities and are available for SDI / analogue video audio signals and RS422 control.

Obviously, their use may be extended to other parts of the transmission chain, such as backup on-air VTRs. An RS422 changeover option is also available for this purpose.

A suitable card frame is available. This is a 1U box which accommodates up to three 2x1 switches and a power supply. The changeover is activated either by a local front panel switch or via a remote socket on the rear of the unit.
