

Prisons

The world's most secure prisons use STENTOFON

STENTOFON has a unique Cell Call system and it's already installed in multi-complex across the world.

Prisons require a tailored, cost effective solution that integrates well with existing platforms, so the STENTOFON AlphaCom system has built in compatibility with: existing or future security systems, integrating administrative communications, audio paging, alarm distribution, wireless signaling, the telephone network and 'man down' systems for guard protection. The latter a primary concern of any correctional facility. Light signaling is an essential part, enhancing and securing the operation in case of mains breakdown, and the cell stations themselves

incorporate redundant backup for power and signaling. Tamper resistant, weather resistant and custom designed stations are available for each critical environment and all are easy to use – once a call has been placed, speech can be made hands-free.

VoIP technology allows the STENTOFON AlphaCom system to perform seamlessly over a building's network, across town or worldwide.

When communication is critical, look to the STENTOFON brand, the brand correctional security professionals depend on.
